

Fortem Capital Alternative Growth Fund

Monthly Report – 31st December 2020

UK & EU – For professional and institutional investors only

Switzerland - this is an advertising document for professional and institutional clients as defined by the Swiss Financial Services Act only.

Investment Objective

The Fund aims to provide positive returns of 4% over the medium to long term, whilst maintaining negligible equity market beta. It will invest in a core portfolio comprised of alternative beta strategies sourced from across the asset class spectrum that provide capital growth, independent of equity market cycles and macroeconomics. The Fund will make a smaller allocation to opportunistic investments that also meet strict capital preservation and investment return criteria.

The Fund Will

- Invest in structural risk premia – i.e. sources of return that are not dependent on equity markets or macroeconomics.
- Take advantage of opportunistic trades caused by structural distortions in derivative markets.
- Employ stringent counterparty controls, limiting credit exposure to high grade sovereign risk.

Monthly Update

2020 will go down as a year in which, in the world of financial markets, the only thing as violent and unprecedented as the bout of volatility experienced at its beginning was the subsequent recovery thereafter. If there is to be one thing that 2020 might be thanked for, it has finally settled the debate over whether fundamentals have been driving asset prices over recent years, or whether accommodative policy has in fact been the main driver. Thus, it should have come as little surprise that risk assets continued on their relentless ascent over December, fuelled by the promise of further stimulus as well as a conclusion to the Brexit saga on European shores.

The Fund added 0.27% over the month. November's primary detractors, namely Equity Quality and FX Value, were December's best performers alongside the Fund's Rates Curve strategies. FX Congestion was the biggest detractor and cost the Fund 0.11%.

When the dust finally settles on this year, it will undoubtedly be remembered as a year of great upheaval on a number of fronts. However, taking markets in isolation, it has overall been extremely rewarding for risk, but at a long term cost (if there is one) yet to be determined. With regards to the great monetary experiment, the Rubicon has undoubtedly now been crossed. There is a fairly universal hope that the ever-expanding balance sheets of global central banks, synchronised with huge increases in fiscal spending and deficits, will not have unintended consequences that lay bare the imbalances now ingrained in the system. If they do, then those that have factored in central bank influence over the returns of various asset classes, and adjusted allocations accordingly, will fare relatively better. The Fund itself remains a key tool in allocating with this new investing paradigm in mind, offering genuine diversification, but having produced positive returns even as equity markets have increased dramatically.

Fortem Capital Alternative Growth Fund

Monthly Report – 31st December 2020

Monthly Update - continued

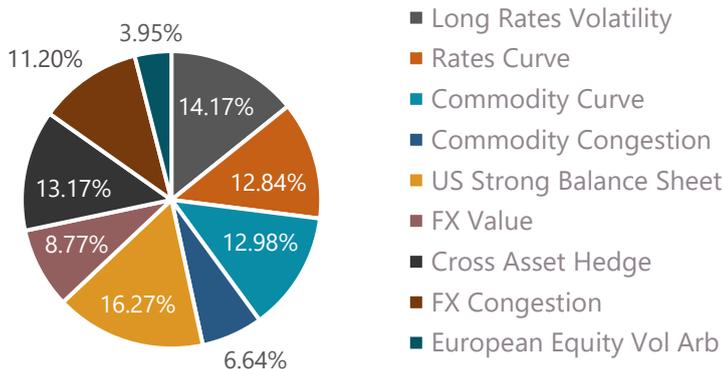

The Fund added one new strategy in December.

An example of the type of structural, uncorrelated return to which the Fund takes exposure is to interest rate volatility in the US. Hedging flows from Asia put downward pressure on the long end of the curve and a lack of MBS participants in the market post-GFC has also removed some upward pressure that was previously there, to the point that the US rates volatility term structure is downward sloping and can be 'rolled up' to generate an uncorrelated premia. A new strategy has been added to the existing one in this space that, in addition to rolling up the curve, has more sensitivity to increasing rates volatility at the shorter end of the curve.

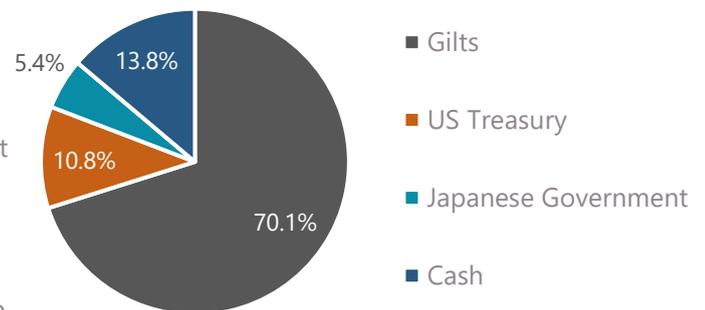

The Fund's objective is to produce positive returns, with low volatility, and negligible correlation to traditional asset classes. 2020 was a true test of any alternative fund's credentials, and those that did their job should fill their investors with confidence. March gave a brief glimpse as to why it is such a useful allocation tool, before the subsequent recovery potentially masked its necessity. The next crisis (and there will be a next) may make its necessity much clearer.

Portfolio Breakdown

Alternative Beta Allocation – Risk weights per Risk Premia

Credit Exposure

Summary of Individual Strategy Risk and Attribution

Portfolio Risk

- **Portfolio Risk** is the expected standard deviation of the portfolio NAV, expressed on an annualised basis. It is calculated using a 10 year correlation matrix
- **Portfolio Stand Alone risk** is the expected standard deviation of the portfolio if there were no diversification benefits between strategies. This occurs if all correlations are at 1.
- **Daily VaR (99%)** is an alternative measure of risk that looks at maximum expected loss. At 99% confidence, one can expect that there will be at least 1 day in a 100 where the daily loss on the Fund can be expected to be greater than the calculated VaR
- **Gross portfolio exposure** measures that total notional value of all the swap positions as a percentage of the portfolio NAV
